

Effective remote cloud management for HAV data

Manage HAV compliance more accurately across one or more sites, right down to the specific individual. **HAVI TOTAL** has been designed specifically to keep all information concerning HAV within a business in just one place. All information is stored on an online database, which can be updated remotely and syncs automatically.

The problems faced by businesses

Many businesses currently focus on showing HAV compliance across the entire workforce. A mixture of factors can interfere with this process resulting in inconsistent and unclear reporting including:

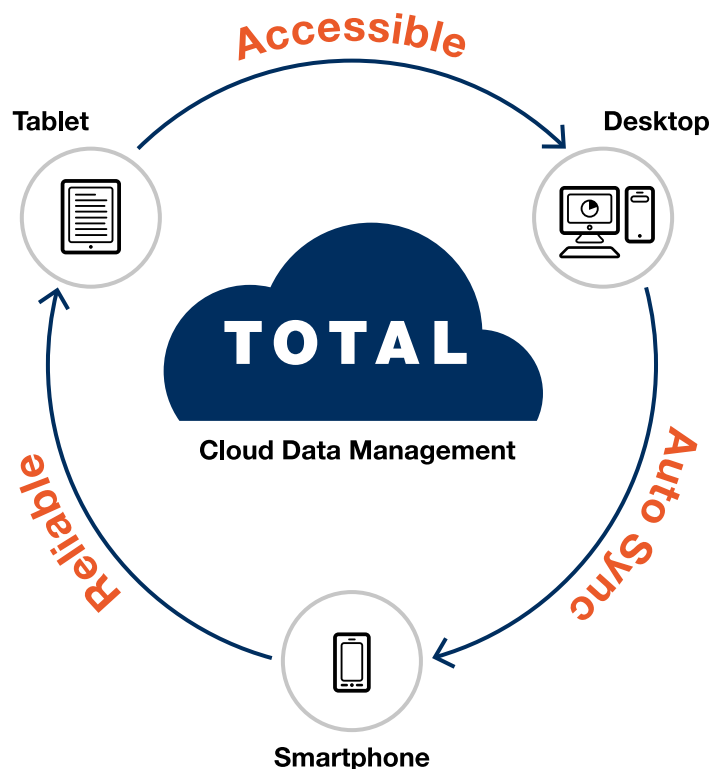

- Delayed knowledge of issues arising
- Non compliance regarding training and health surveillance
- Excessive paperwork
- The sheer numbers of people involved
- Sparse data – no specific task specific data management

Each of these factors can lead to inconsistent compliance reporting across the whole business. A company may have good compliance across 90% of the business, the remaining 10% may not be compliant and can lead to negative views of the entire business.

The solution we provide

A system that eliminates all paperwork and hard copy documentation from company HAV policies, a system that keeps everything in one place and that can be accessed by a number of nominated managers across different sites. Ensuring all risk assessments, training information and health surveillance results are recorded and acted upon.

HAVI TOTAL gives organisations the tools they need to access information for different sites, and to assess whether they are compliant or not.

A truly **multi-platform** system suitable for use with:

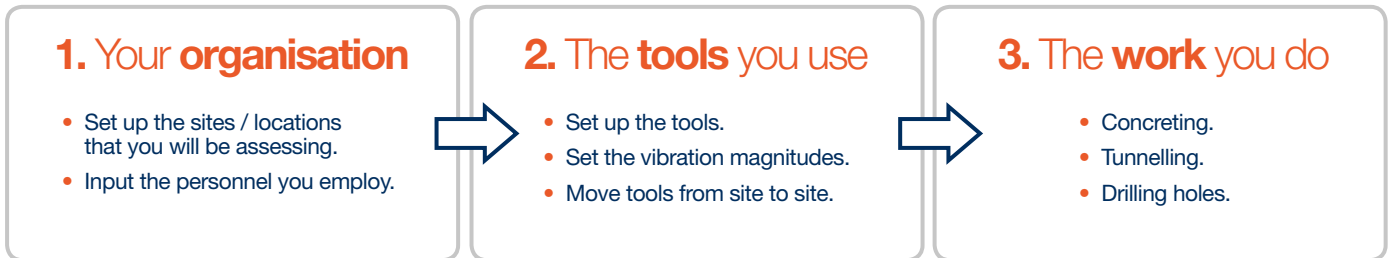

Tablets

Smartphones

Laptops

Desktop computers

Set up in three simple steps

1. Your organisation

- Set up the sites / locations that you will be assessing.
- Input the personnel you employ.

2. The tools you use

- Set up the tools.
- Set the vibration magnitudes.
- Move tools from site to site.

3. The work you do

- Concreting.
- Tunnelling.
- Drilling holes.

Once HAVI TOTAL is up and running, what records can I see?

- Training.
- Health Surveillance outcomes.
- Where staff have been working.
- What their exposure has been.
- What is their level of risk.
- Assessments they have been involved in.

This information can then be scrutinised and as a company you will see exactly where you are at risk and which areas require focus.

HAVI TOTAL gives businesses an opportunity to keep HAV compliance information in just one place, with access at all times, even without an internet connection.

How access to the system works

Organisations can obtain three levels of access and once the platform is up and running it is quick and very simple to use.

- **Super users** - Access all areas. These users will have access to all data and will have the ability to update, delete and edit relevant information.
- **Site users** - Access to certain pieces of information such as; that of particular site, plus view information on different sites (if applicable) to see best practice, e.g. alternative methods of works or new / better tooling.
- **Bespoke users** - Certain access determined by you. e.g. HR Access for training records.
